

Special Buttons

The **Special Buttons** are shown below:

These buttons are described below.

Text Area Control

This set of buttons controls the SQL text that is currently being displayed. It is possible to have many open SQL texts. They are selected from the drop-down list (when first opening it is one text called Untitled 1).

Adding a new SQL text is simply a matter of clicking on the Plus button. Clicking on the Minus button will close the currently displayed SQL text.

If you load or save a text then the name changes in the drop-down list to the name of the file.

Select Button

This is the same as submitting the SELECT statement to the database. It assumes that there will be a set of records returned from the query which will then be displayed in the lower data display table.

Execute Button

This is the same as submitting an EXECUTE statement to the database. It assumes that there is no return value from the database other than an error.
