This software is supplied free of charge and no warranty is given or implied, all use is at the user's own risk.

The idea is to offer a database manager designed specifically for SQLite. SQLite Control will handle many things:

- The creation of a new database
- Adding and Modifying Tables
- Adding and Modifying Indexes
- Adding and Modifying Triggers
- Reviewing Views
- Ad Hoc SQL
- Processing SQL Scripts

A special thanks has to be given to Dave Sisemore, without whose help, advice and guidance I could not have created SQLite Control. He is producing his own version of an SQLite Manager, called Tadpole, that will be released on his own website in due course.

Dave's website is called "The IveBeenThinking Application Store" and his website address is <http://www.rdsisemore.com>.
